

Water supply	Description
Rainfed	Crop(s) establishment and development is completely determined by rainfall.
Mixed rainfed–irrigated:	The application of a limited amount of water to the crop when rainfall fails to provide sufficient water for plant growth, to increase and stabilize yield; the additional water alone is inadequate for crop production.
Full irrigation:	Any of several means of an artificial regular supply of water, in addition to rain, to the crop(s).
Post-flooding:	After rainwater has naturally flooded the field (e.g. in Wadis, riverbanks), the water infiltrated into the soil is used intentionally as a water reserve for crop cultivation. The crop(s) use(s) this water reserve for establishment.
